                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       d. No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protein search,

BIOCHEM. Pharmacol. 49:1323-1329(1995).

C -!- FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTH C OF GUANINE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REGULA OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.

C -!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NADH.

C -!- STATHAAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.

C -!- SUBUNIT: HOMOTETRAMER.

C -!- SUBUNIT: HOMOTETRAMER.

C -!- TISSUE SPECIFICITY: IMP TYPE I IS THE MAIN SPECIES IN NORMAL LEUKORYDTES AND TYPE II PREDOMINATES OVER TYPE I IN THE TUMOR.

C -!- SIMILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO GMP REDUCTASE.

J. Biol. Chem. 263:15769-15772(1988).
-i- FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SY OF GUANINE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REG OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.
-i- CATALYTIC ACTIVITY: INOSINE 5'.phosphate + NADH. Xanthosine 5'.phosphate + NADH.
                                                                                                                                                                                                                                                                                                                                                                                        Pfam; PF00571; CBS; 2.

OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF
MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.
CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)O =
Xanthosine 5'-phosphate + NADH.
PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
SUBUNIT: HOMOTETRAMER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LEUKOCYTES AND TYPE II PREDOMINATES PTM: The N-terminus is blocked. Biophys. Acta 1217:156-162(1994).
FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTH OF GUANNIE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REGULA OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.
CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)0 = Xanthosine 5'-phosphate + NADH.
PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
SUBUNIT: HOMOTETRAMER.
SIMILARITY: TO OTHER EUKARRYOTIC AND PROKARYOTIC IMPDH AND TO
                                                                                                                                                                                                                                                                                                                      SIMILARITY: CONTAINS 2 CBS DOMAINS

Bacteriol. 179:2331-2338(1997).

-!- FUNCTION: ESSENTIAL ENZYME IN THE DE NOVO BIOSYNTHESIS CATALYSING THE NAD-DEPENDENT OXIDATION OF IMP TO XMP.
-!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2 xanthosine 5'-phosphate + NADH.
-!- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
-!- DEVELOPMENTAL STAGE: EXPRESSED AT EQUAL LEVELS IN THE Y
                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDILINE-9734646; PubMed=9079920;
